

CLAIMS

- 1 1. A permalloy sensor device having high sensitivity, comprising:
2 a substrate and a sensor on said substrate, said sensor having a first
3 surface, said first surface having a wafer level anisotropy in a given
4 direction; and
5 a permalloy resistor pattern of individual runners deposited on
6 said first surface such that the mechanical length of each of said
7 individual runners is perpendicular to the wafer level anisotropy to cause
8 said sensor to have an anisotropy of about 90°.
- 1 2. The device of claim 1, wherein said permalloy is deposited as a
2 thin film.
- 1 3. The device of claim 2, wherein said substrate is a silicon wafer.
- 1 4. A permalloy sensor having high sensitivity, comprising:
2 substrate means for forming the body of a sensor and having a first
3 surface, said first surface having a wafer level anisotropy in a given
4 direction; and
5 permalloy resistor pattern means for providing individual runners
6 deposited on said surface such that the mechanical length of each of said
7 individual runners is perpendicular to the wafer level anisotropy to cause
8 said sensor to have an anisotropy of about 90°.
- 1 5. The of claim 4, wherein said permalloy is deposited as a thin film.

1 6. The of claim 5, wherein said substrate is a silicon wafer.

1 7. A method of forming a permalloy sensor including the steps of:
2 providing a substrate and a sensor on said substrate, said sensor
3 sensor having a first surface, said first surface having a wafer level
4 anisotropy in a given direction; and
5 depositing a permalloy resistor pattern of individual runners on
6 said surface such that the mechanical length of each of said individual
7 runners is perpendicular to the wafer level anisotropy to cause said
8 sensor to have an anisotropy of about 90°.

1 8. The method of claim 7, wherein said permalloy is deposited as a
2 thin film.

1 9. The method of claim 8, wherein said substrate is a silicon wafer.
